But not all was well...

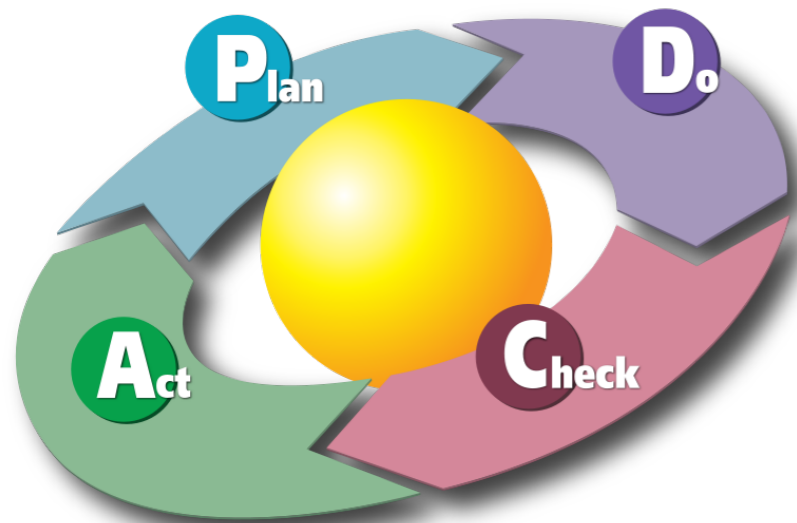

Kaizen spirit ?

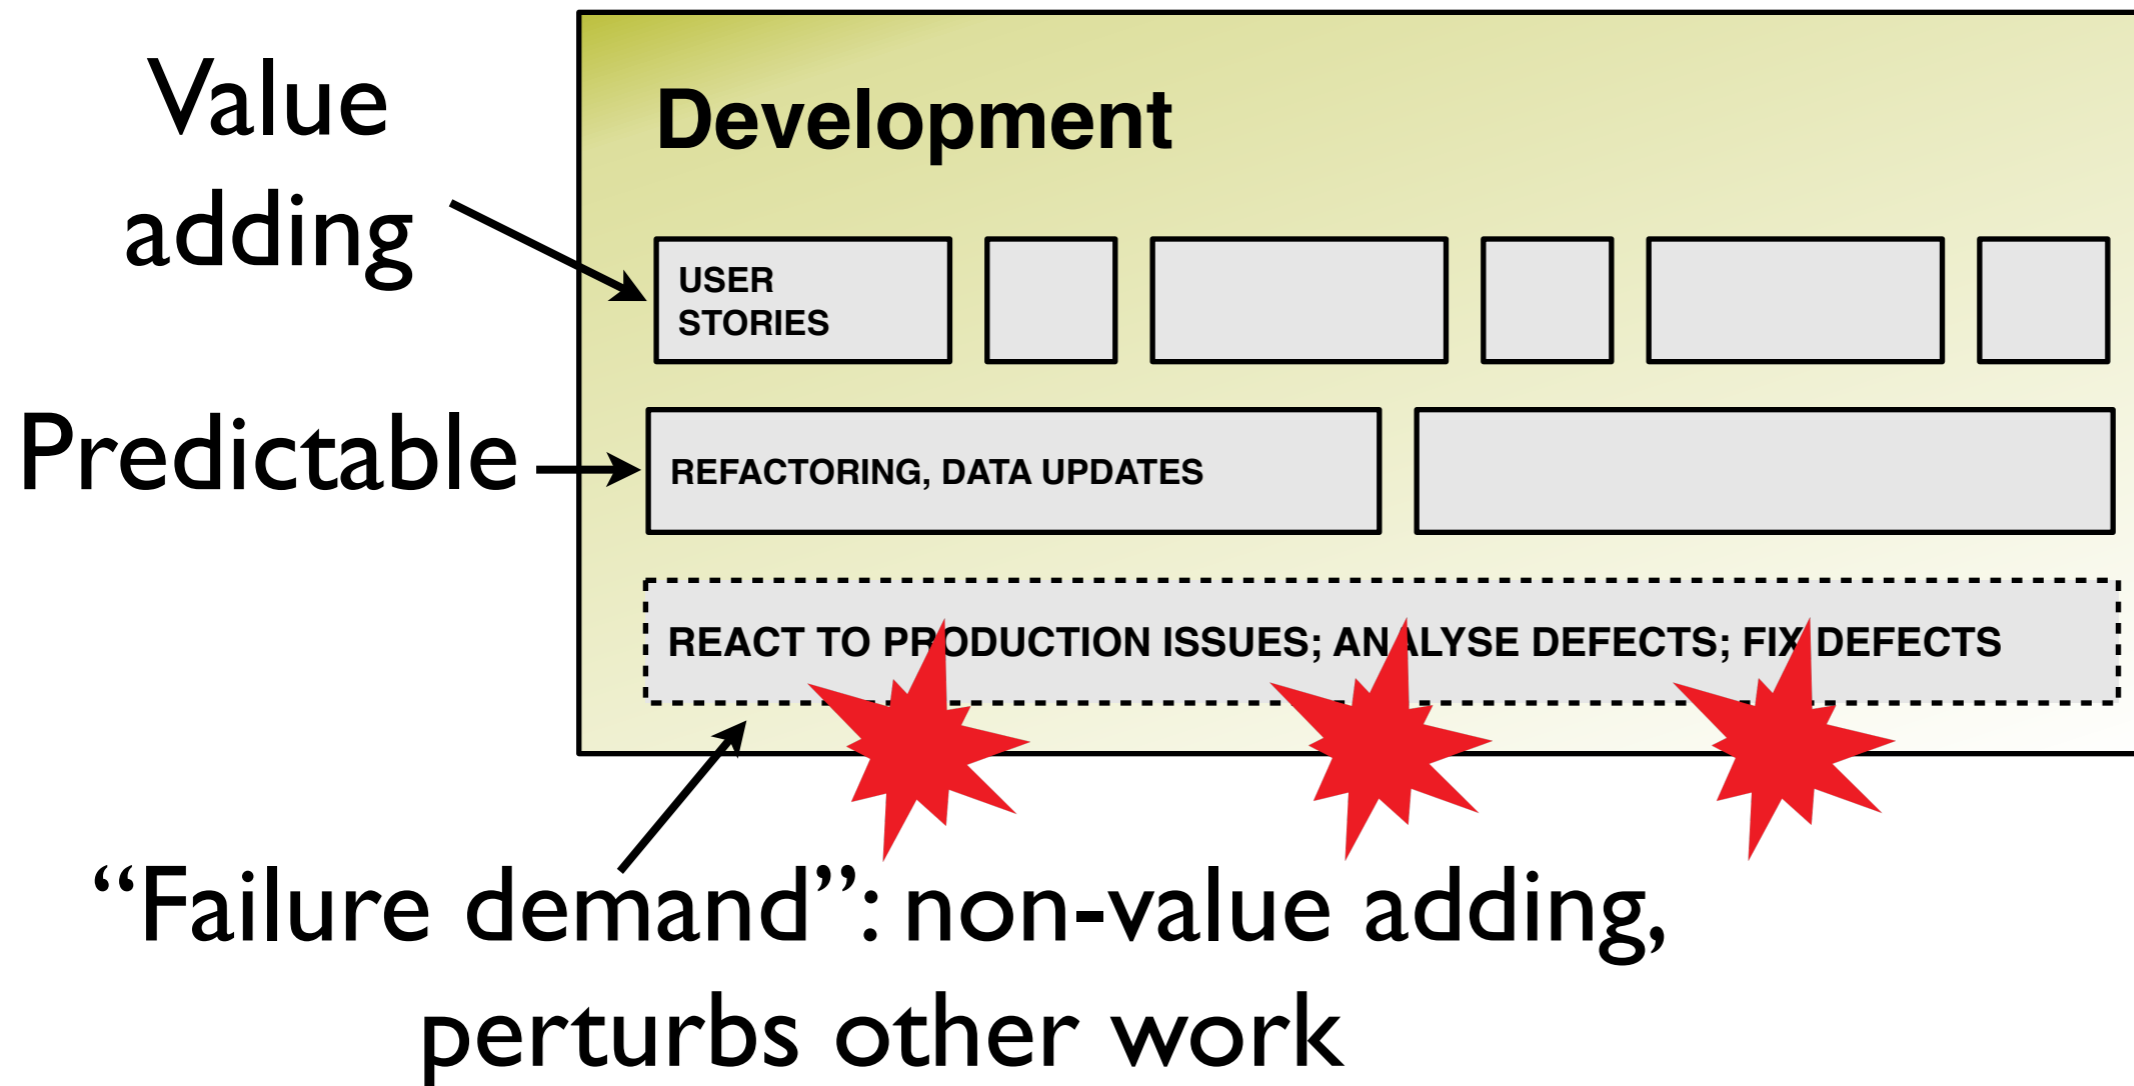

The actual process...

“Why is everything taking so long?”

CORE profile

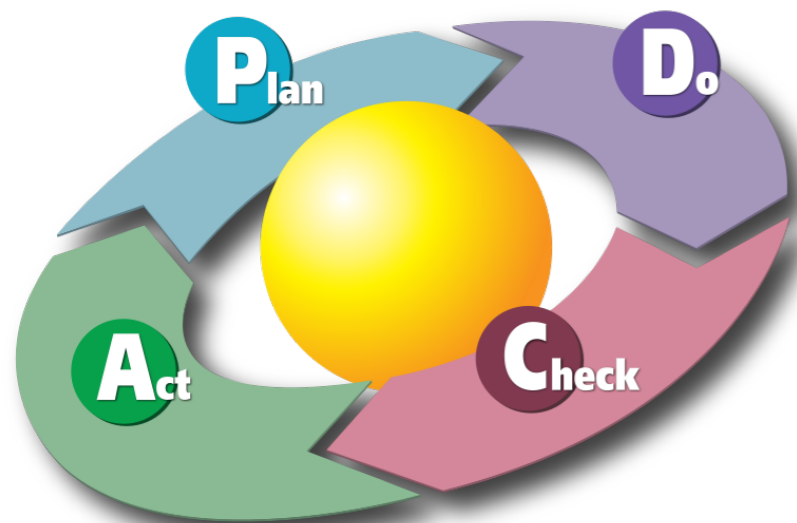

Based on the CORE profile tool, cf.

<http://www.slideshare.net/operaepartners/lean-it-strategy-lean-measurement-and-organizational-design>

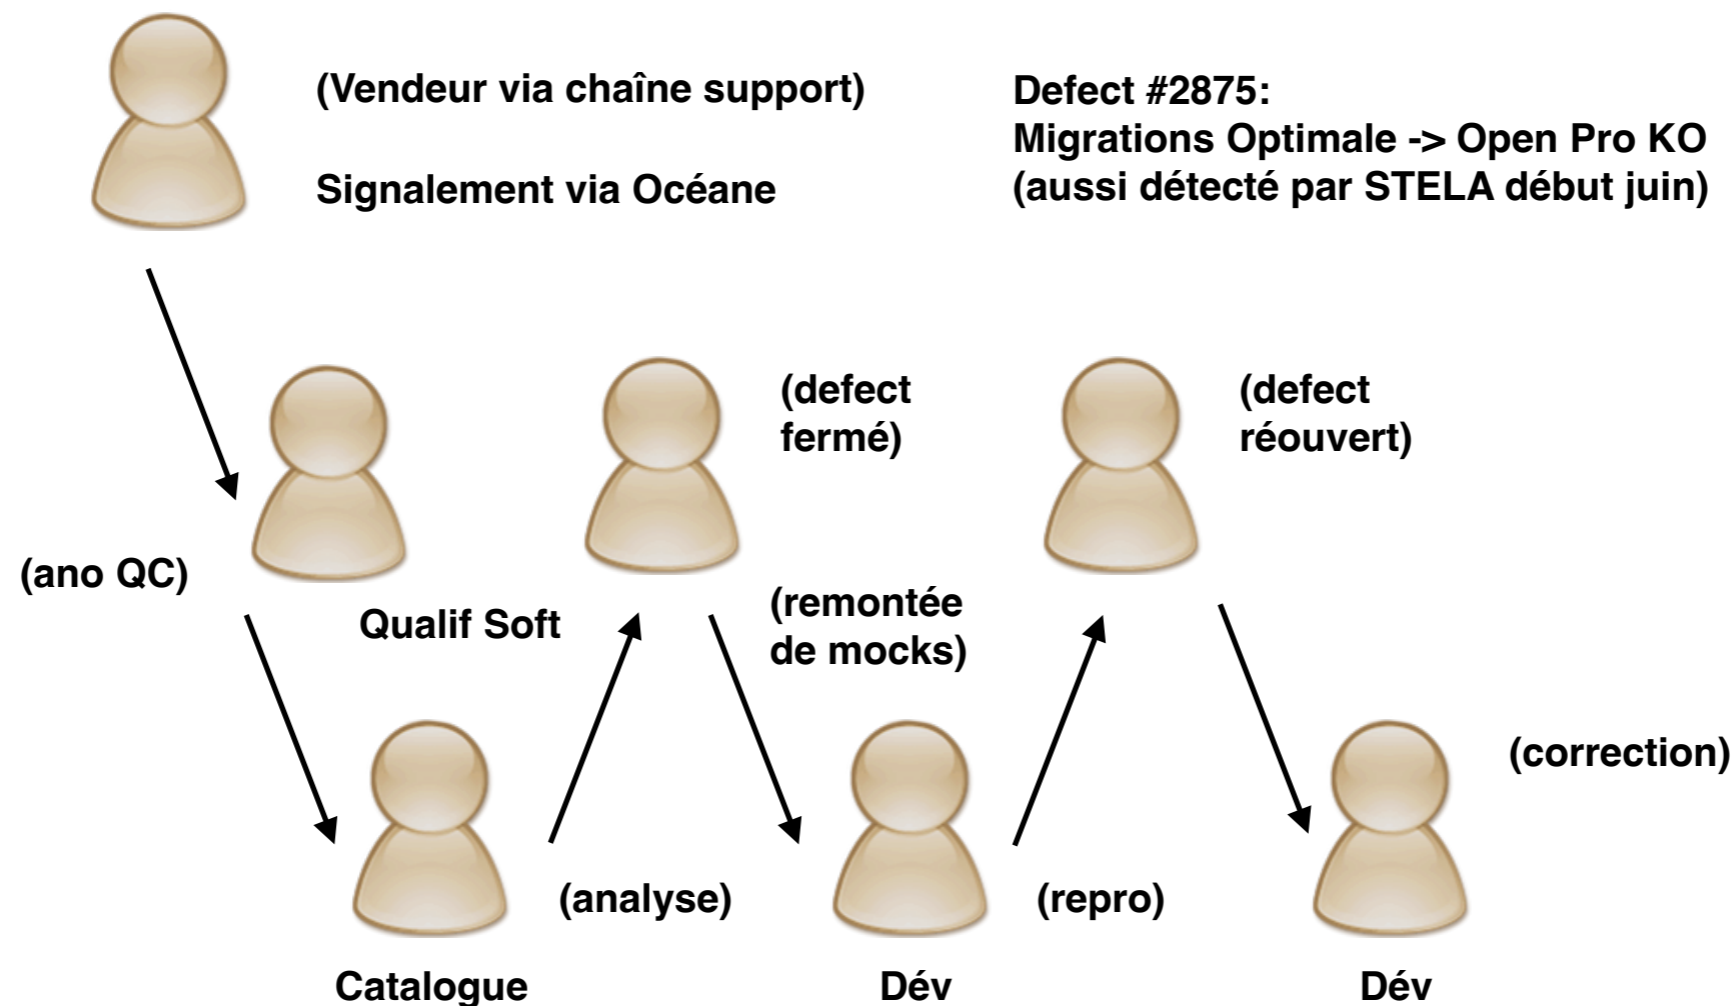

End user impact

- Constant background grumbling from end users, eroding confidence in product
- Flaring up into occasional crises on “MEP” days (deployments, roughly monthly)
- Substantial monetary impact: each failed order is re-processed manually

Why are defects slowing us so much?

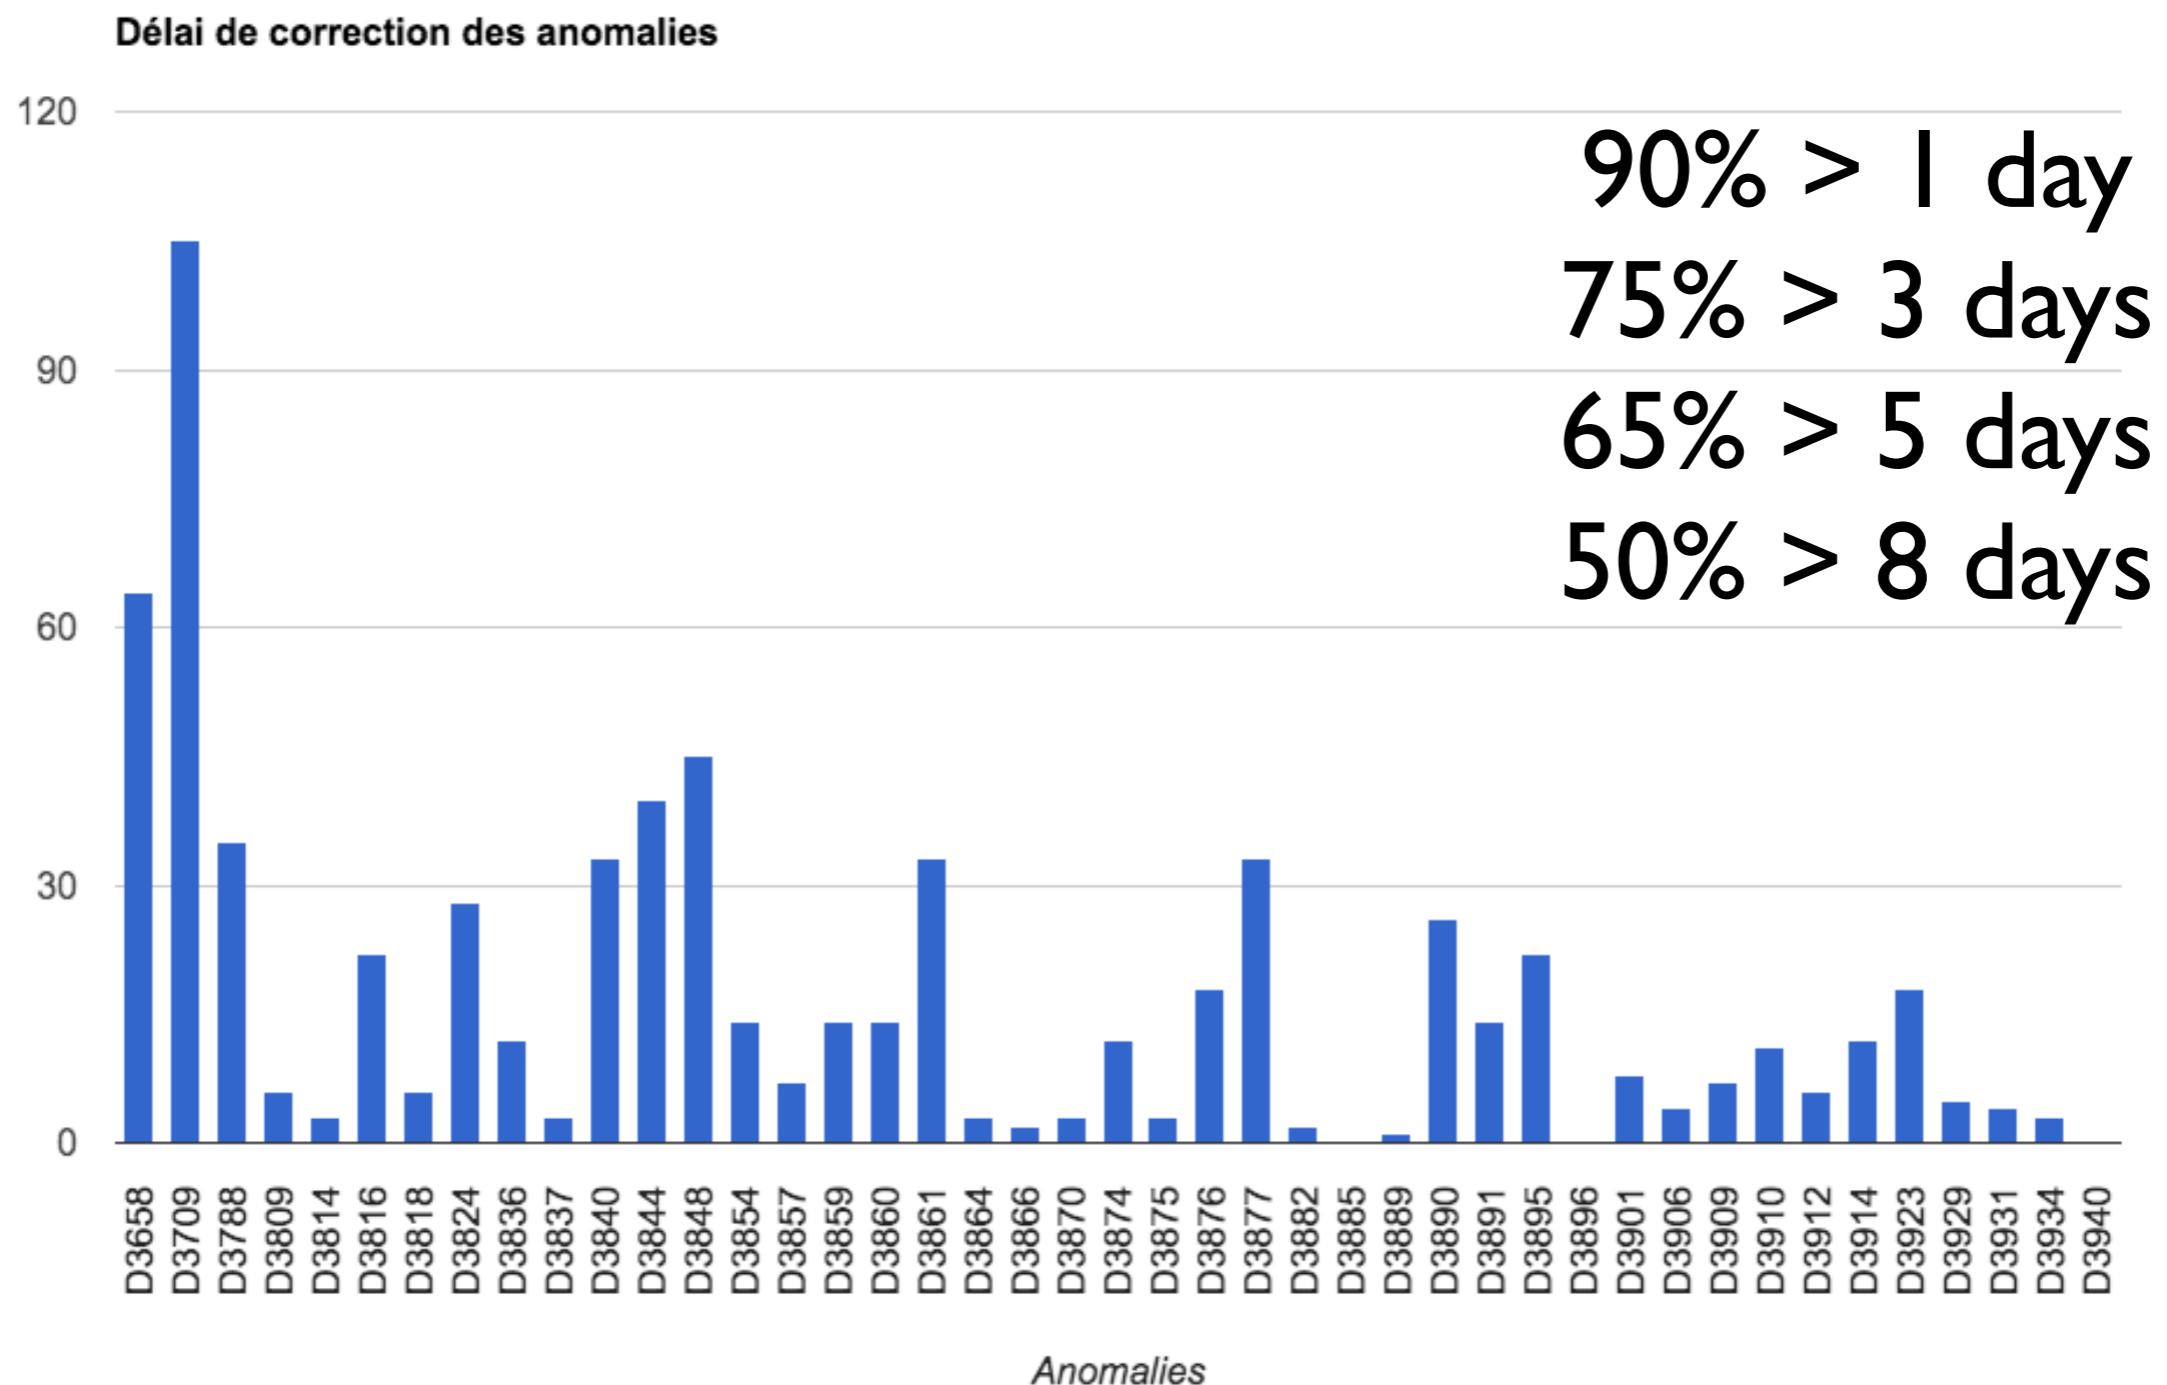

“Staple yourself to a bug”

- Total lead time: 6 weeks

Best repeatable performance?

An aerial photograph of a large, white, irregularly shaped iceberg floating in deep blue water. The iceberg's surface is textured with numerous small, rounded protrusions and indentations. Directly beneath the iceberg, the water glows with a vibrant green light, creating a circular area of illumination that contrasts sharply with the surrounding dark blue water. The text "Hidden costs of production defects" is overlaid in white at the bottom of the image.

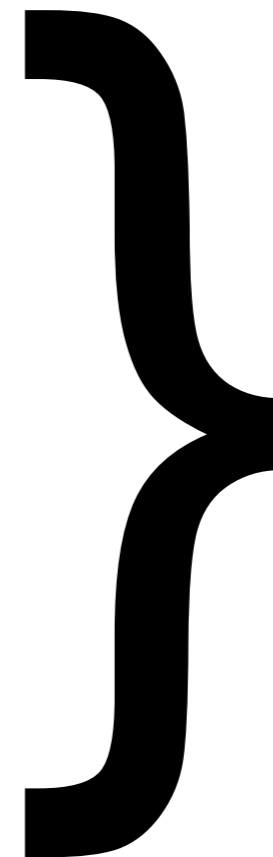

Hidden costs of
production defects

“Passive cost windows”

- Bug introduced
- Bug shipped
- Bug detected
- Bug reported
- Bug fixed
- Fix shipped

A delicate subject must
now come up...

(Persons of a delicate
disposition are advised
to cover their ears)

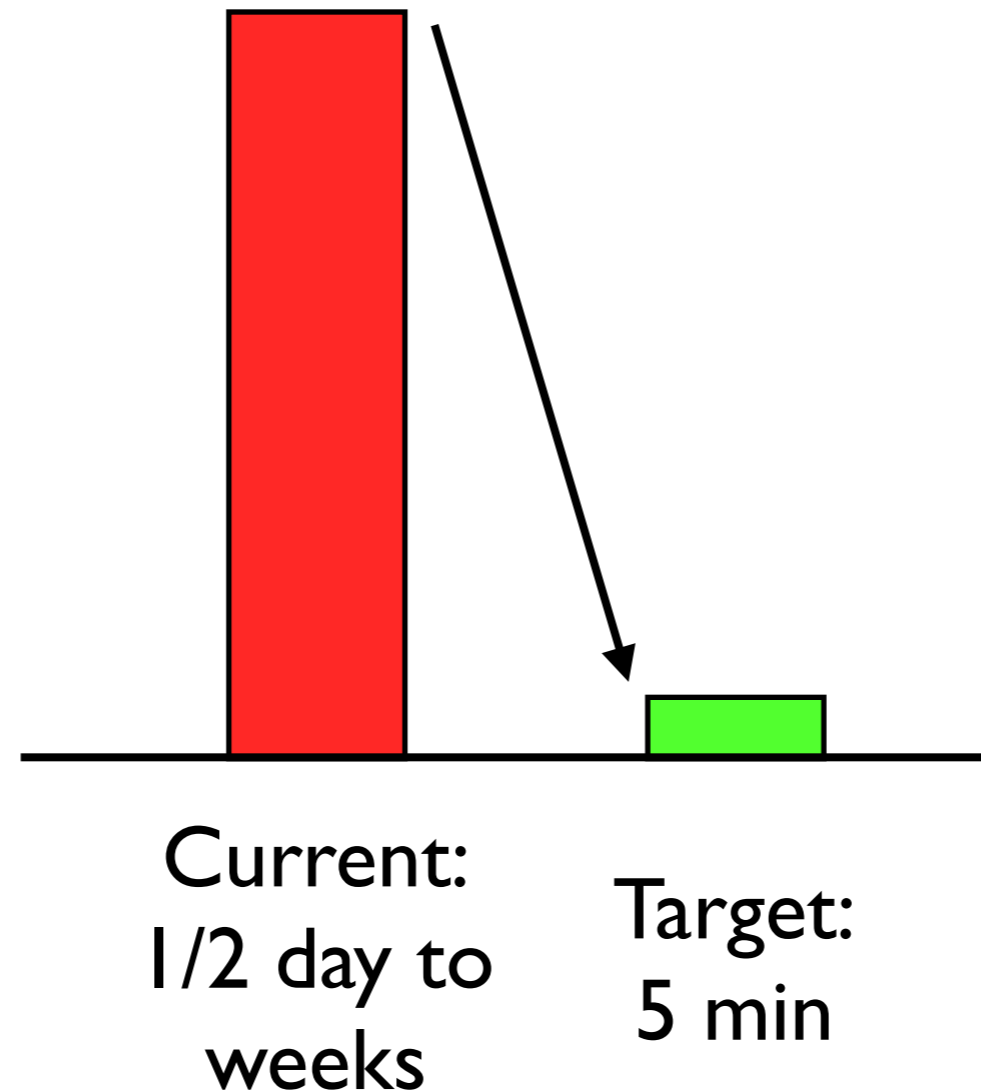

Bug reproduction!

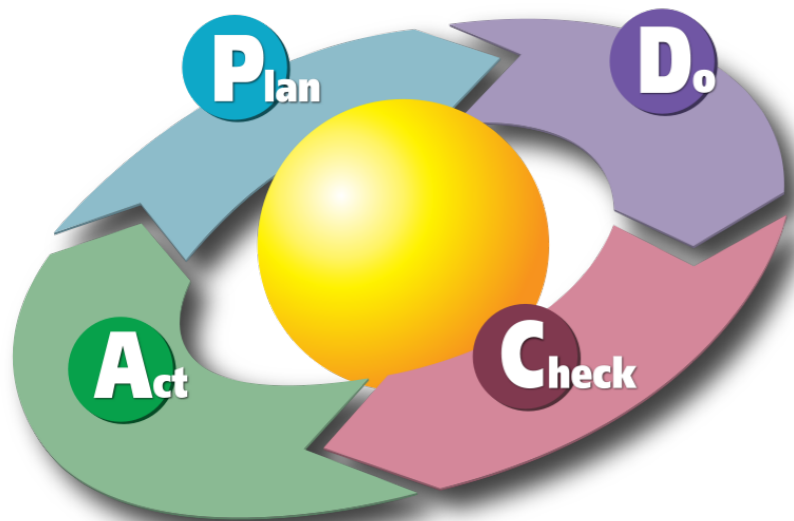

“Repro” the key to improving the process?

- Minimum time for a repro: 1/2 day...
- ...often stretching to a few days...
- ...sometimes up to several weeks!

Setting goals for “repro” lead time

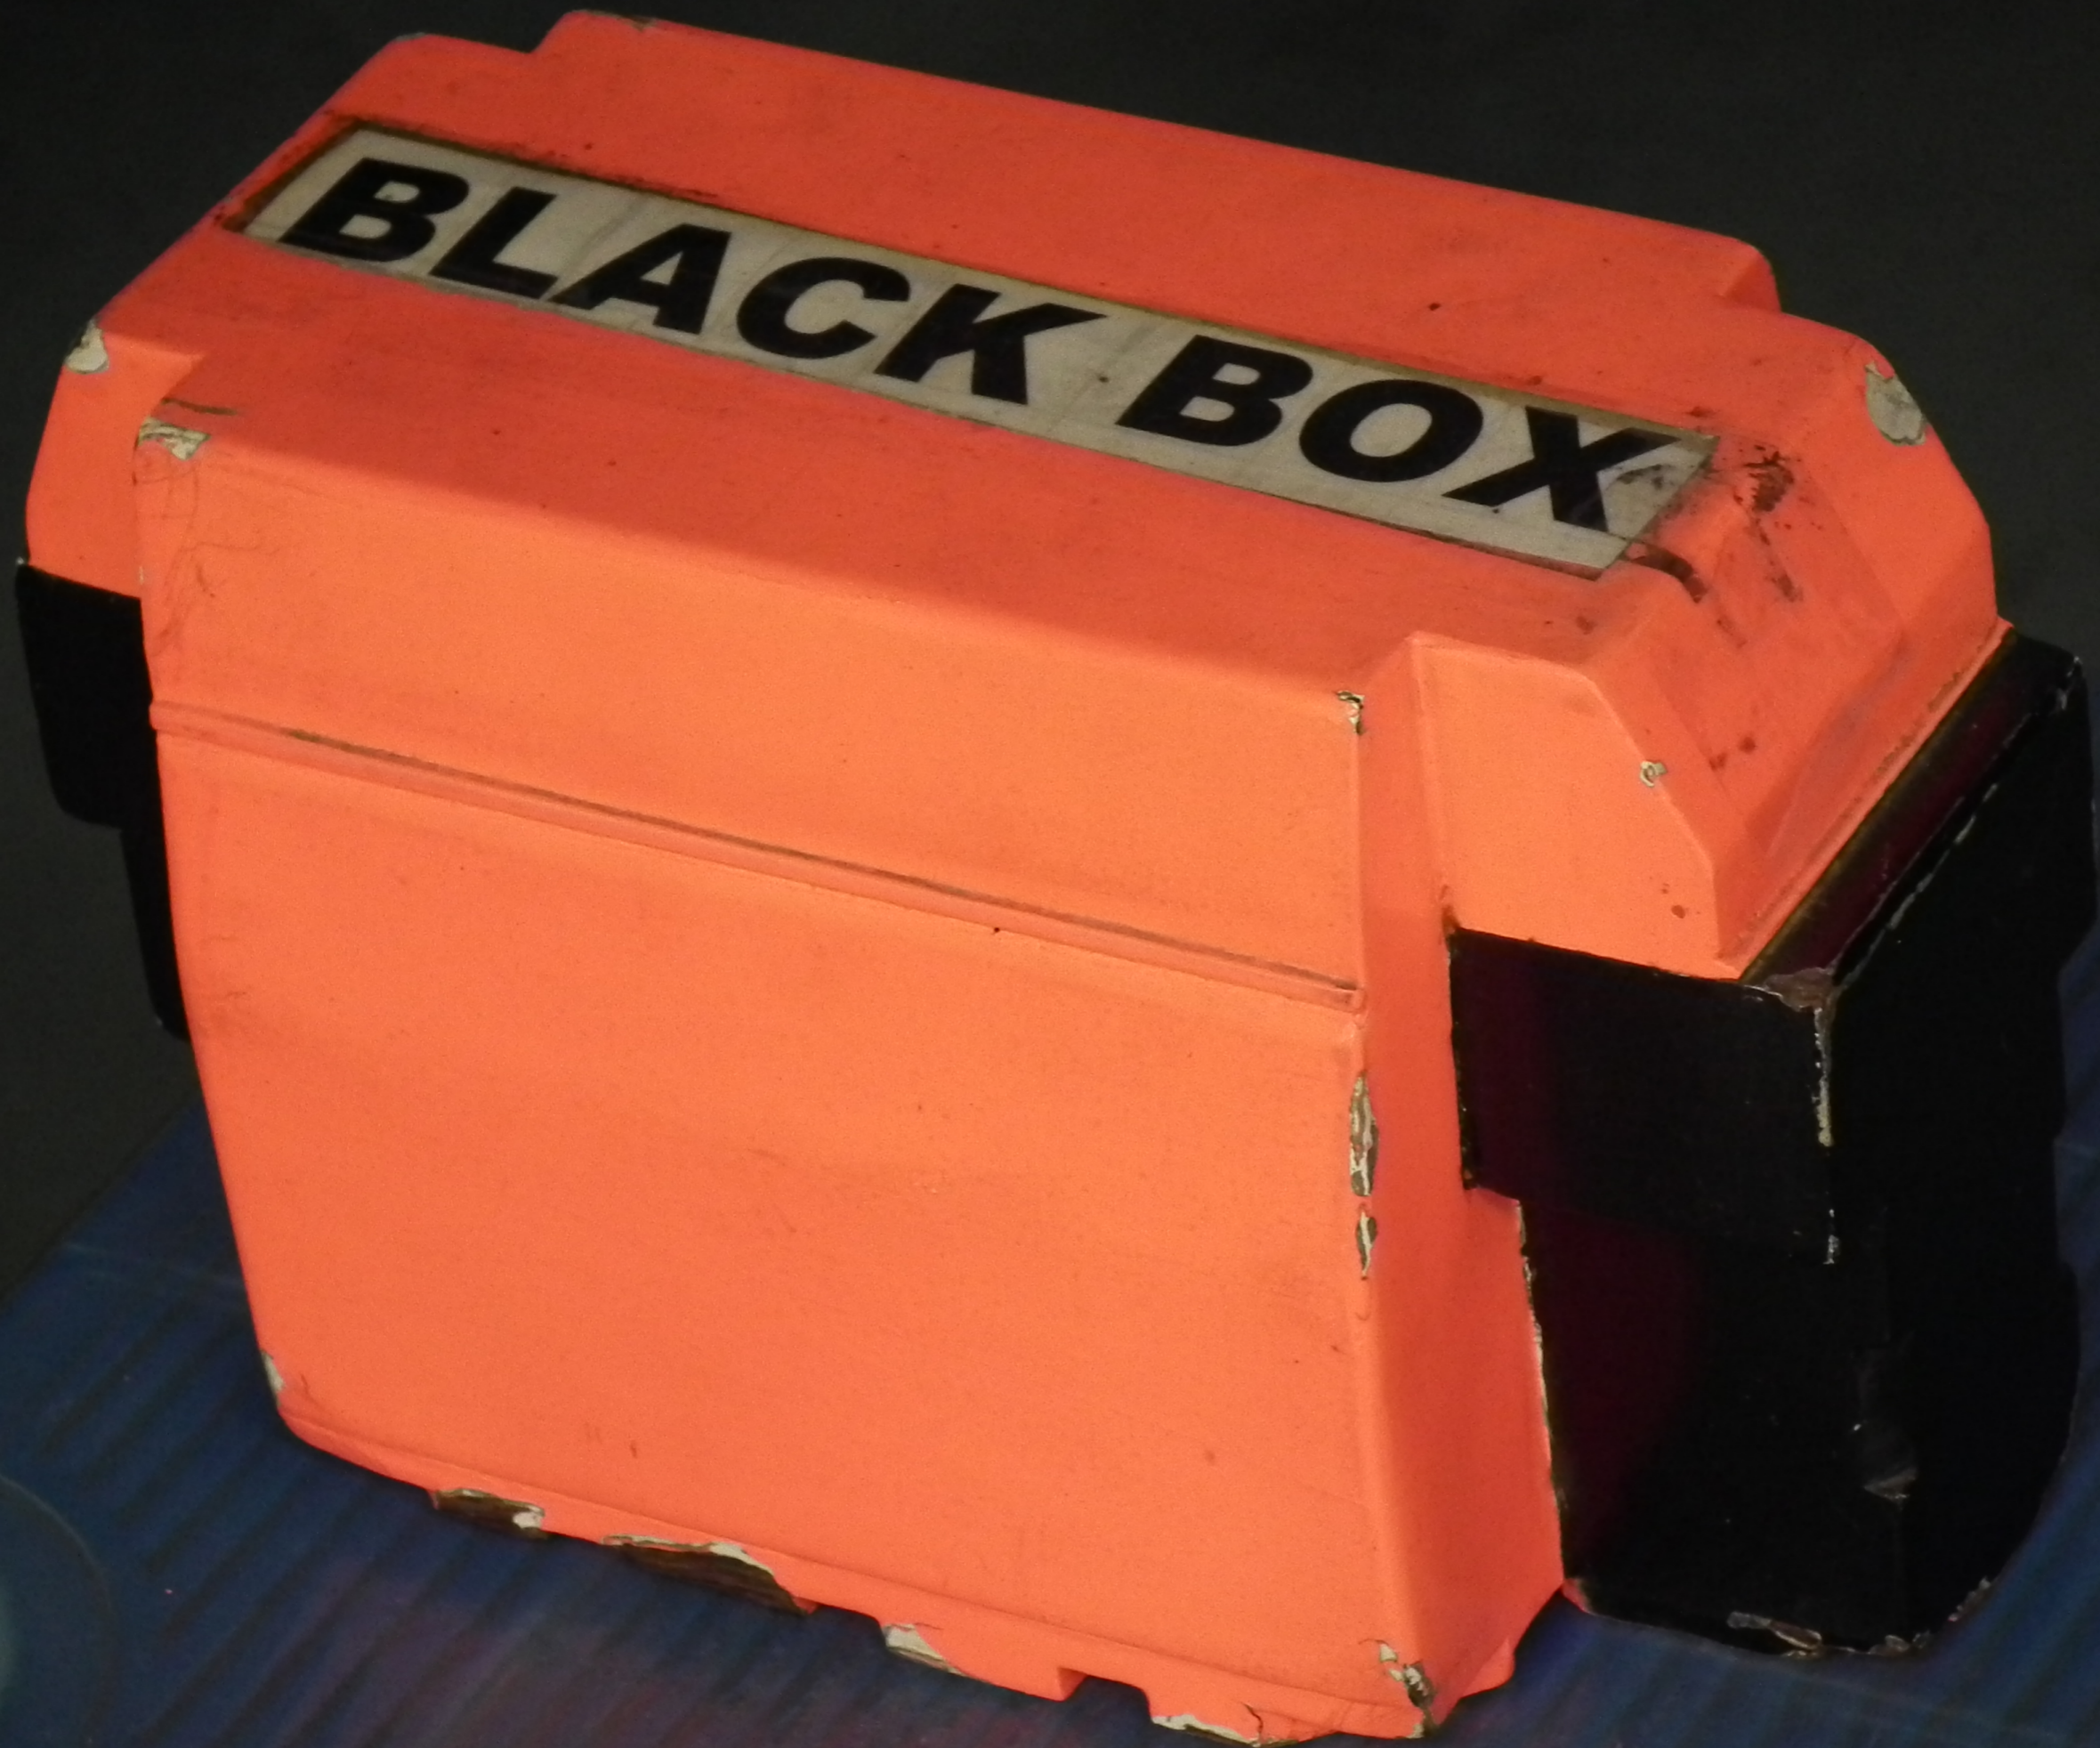

What's so hard about repro-ing defects?

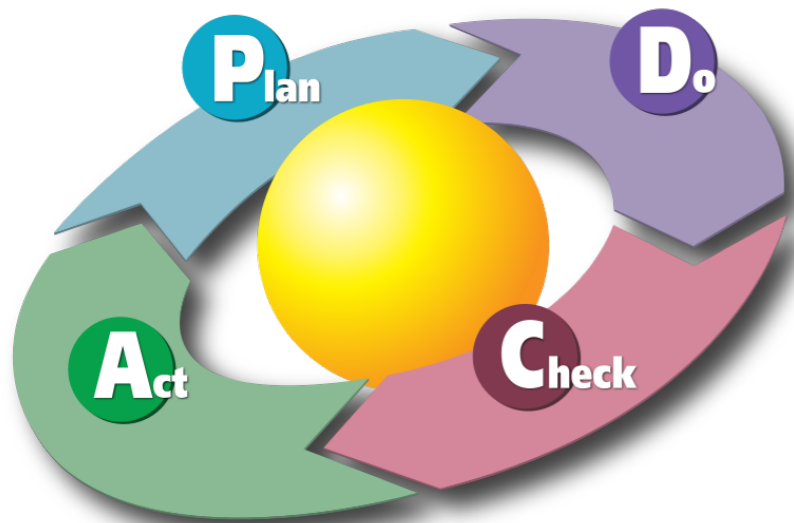

An aerial photograph showing a massive raft of cut logs floating down a wide river. The logs are densely packed and arranged in neat rows, held together by thin wires. Two tugboats are visible: one in the foreground to the right, pushing the raft, and another further upstream. The water is a calm, greyish-blue. The raft extends from the bottom left towards the top center of the frame.

Incomplete
logging...

BLACK BOX

What's so hard about repro? Take 2...

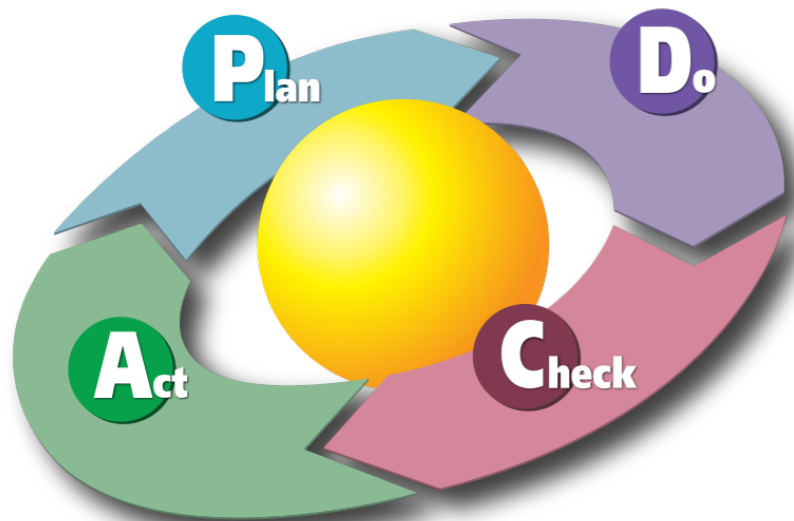

Standardized work: software defects

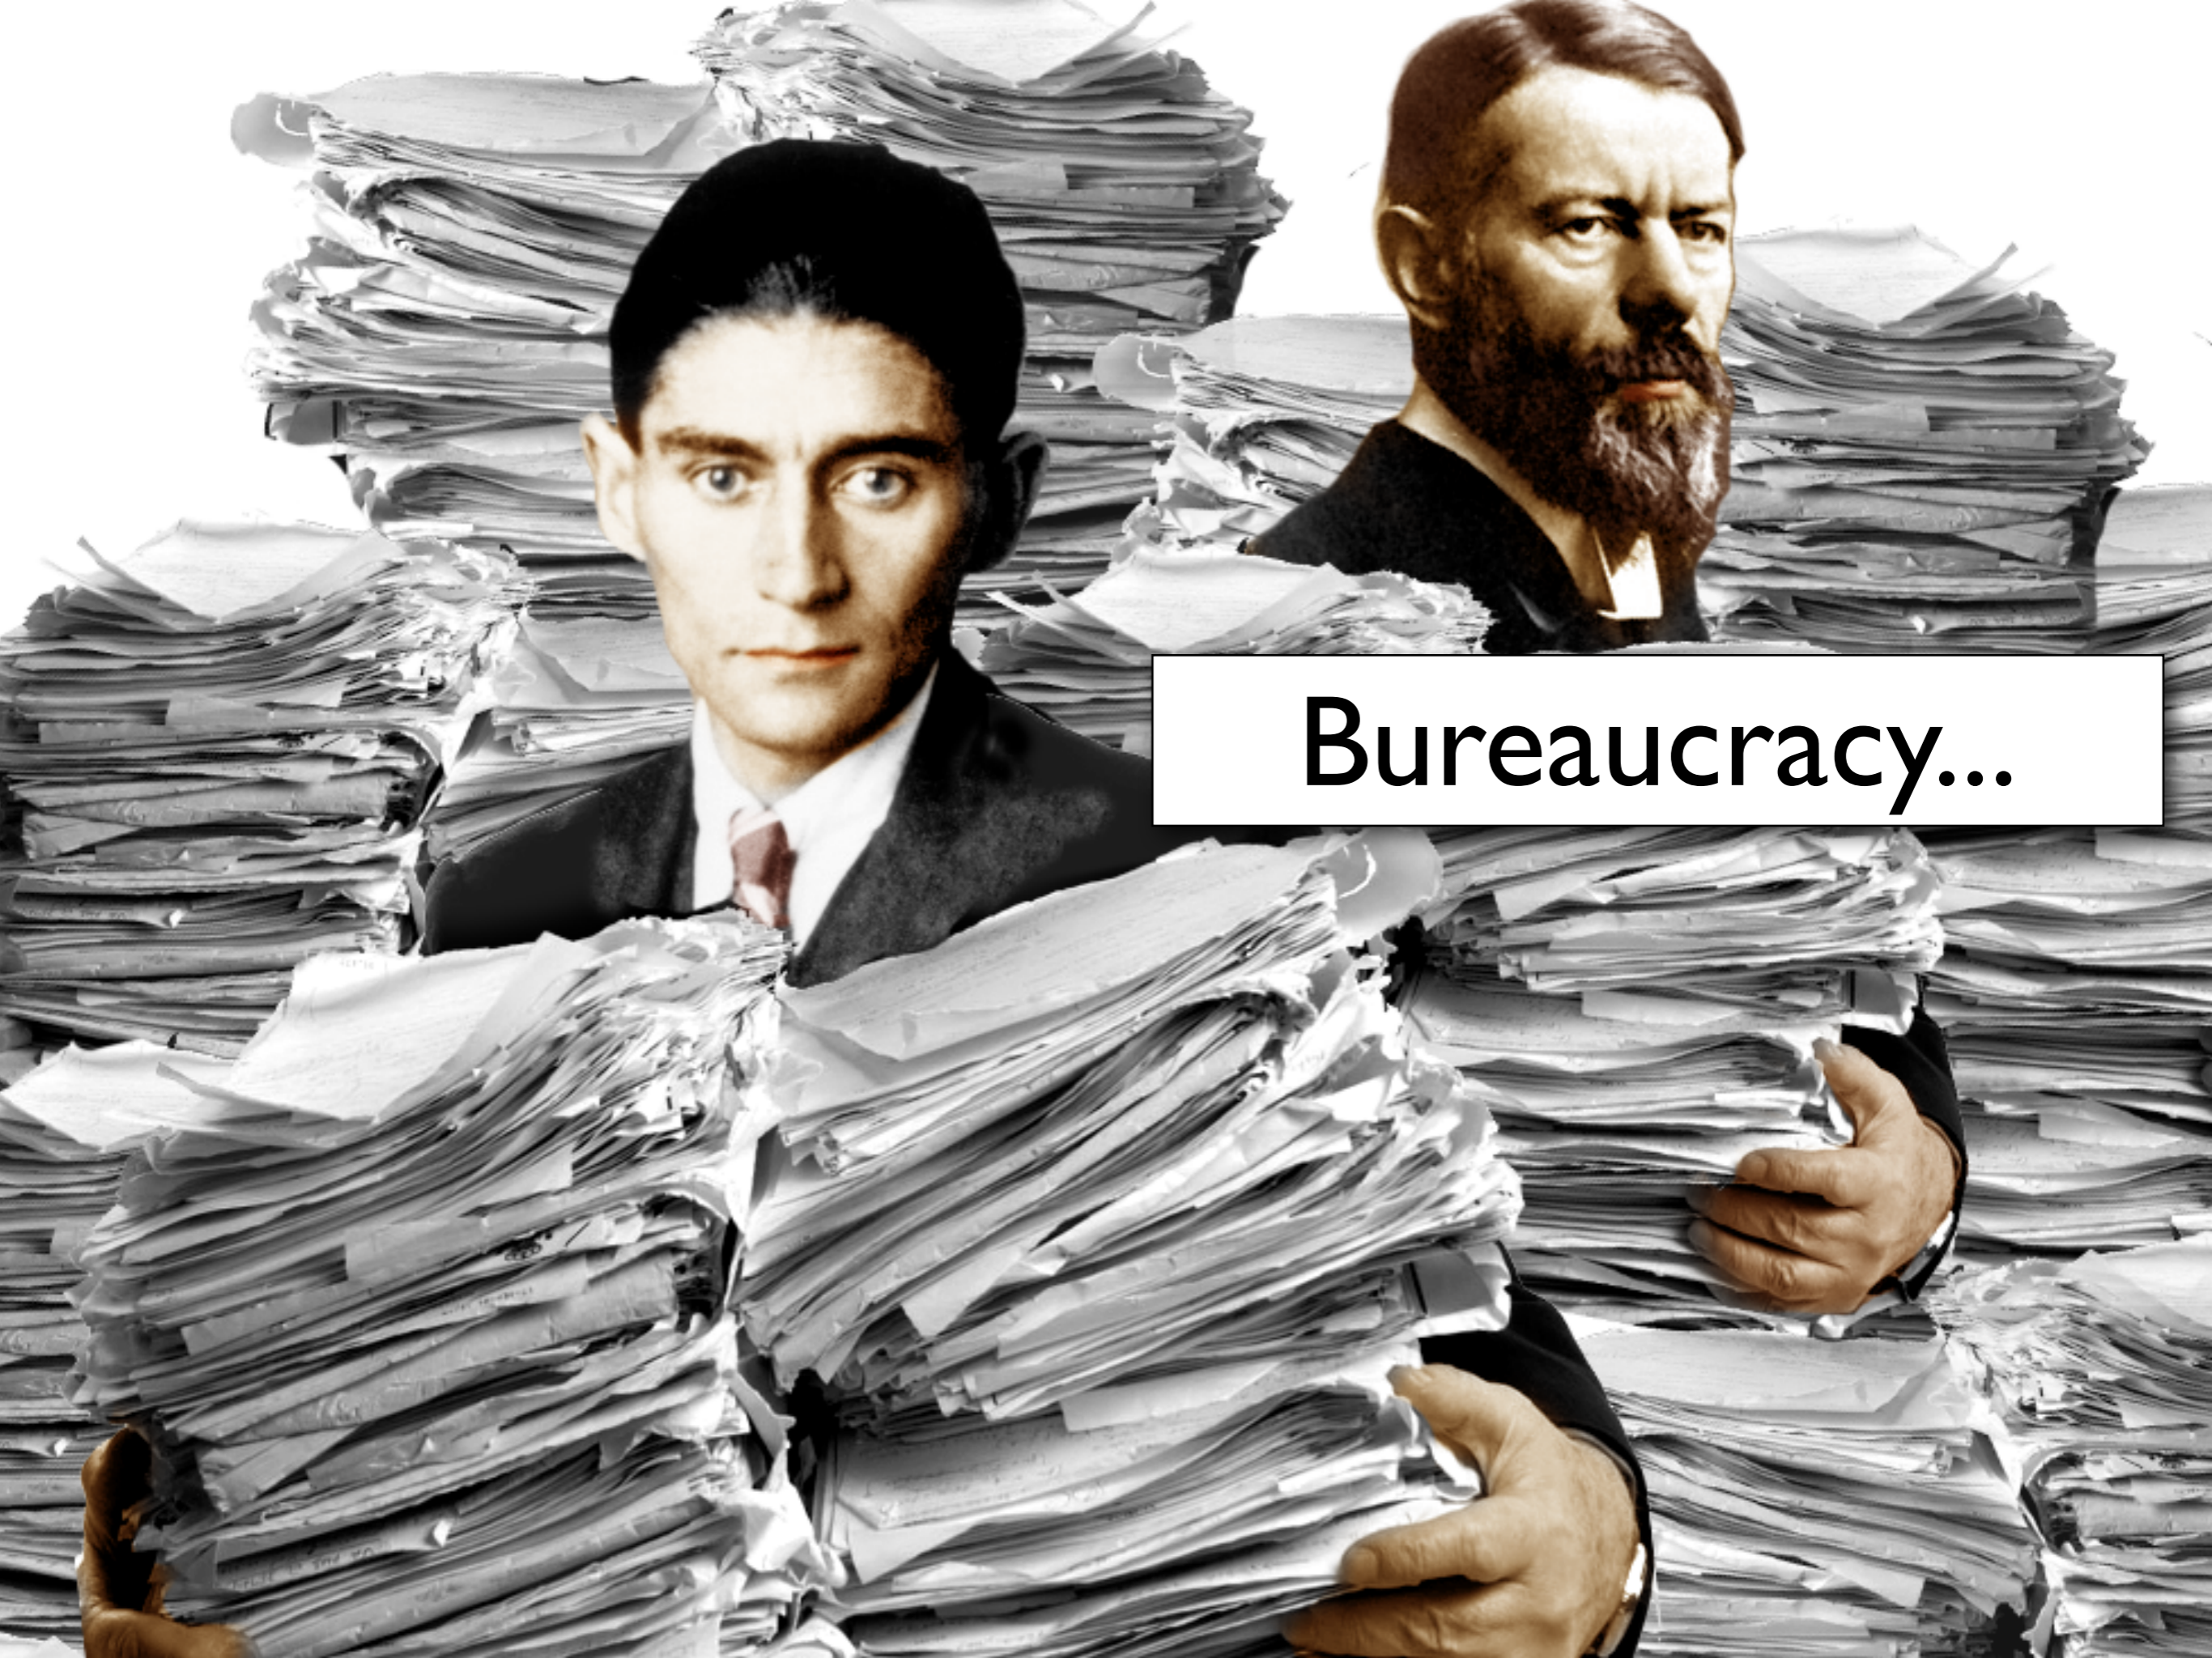

- Repro needs inputs identical to production:
 - same third-party inputs (web services)
 - same path through application
 - same configuration settings
 - same database version
 - same application version

Standardized work: software defects

- After getting a good “repro” and only then:
 - identify causes (debugger, static analysis)
 - “necessary and sufficient conditions”
 - capture as an automated test

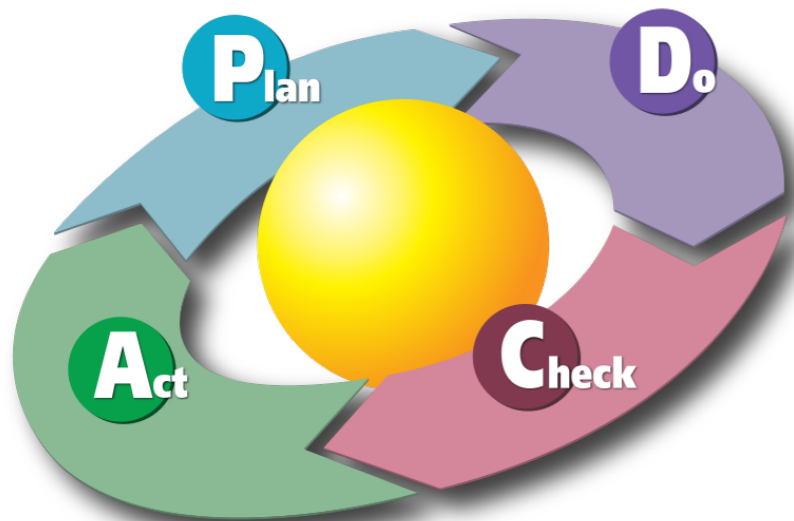

What's so hard about repro? Take 3...

Bureaucracy...

Why are test environments a scarce resource ?

Devops to the rescue!

Infrastructure as Code

Wednesday 17 October 12

http://bit.ly/jedi_iac

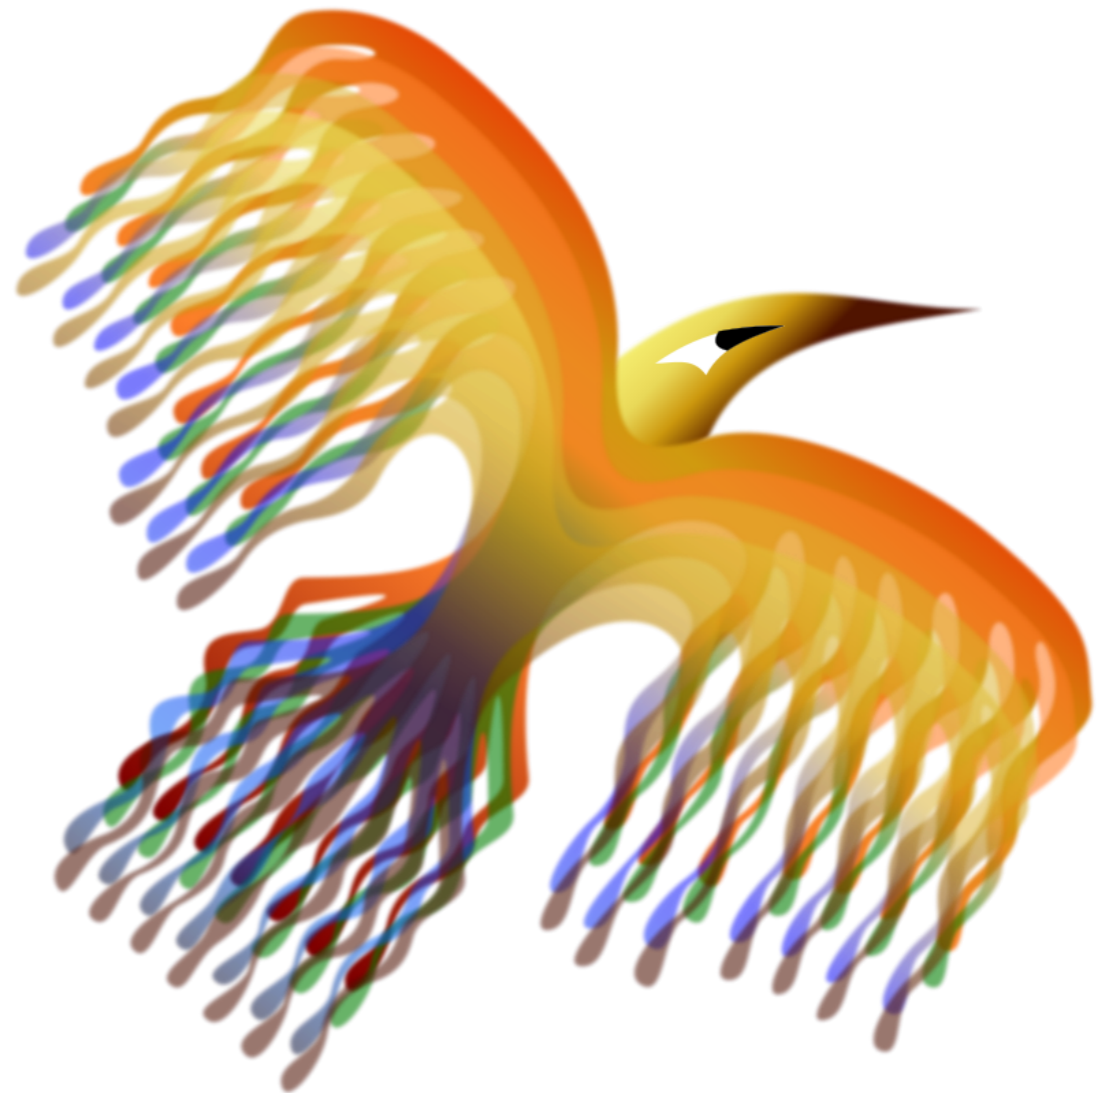

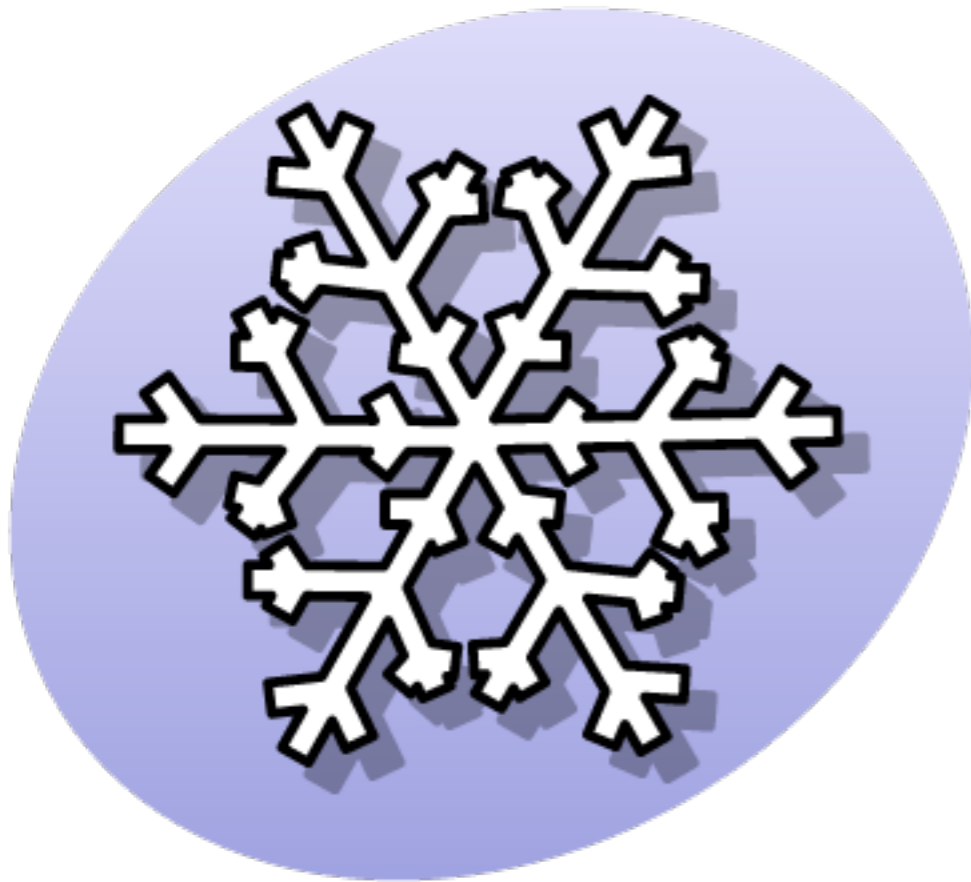

Infrastructure?

- Physical servers
- Virtual machines
- Network links
- Operating systems
- Application dependencies
- Application containers (e.g. JonAS)

“as code”?

- everything is a text file (no manual setup)
- under version control, with commit messages
- ideally with automated tests

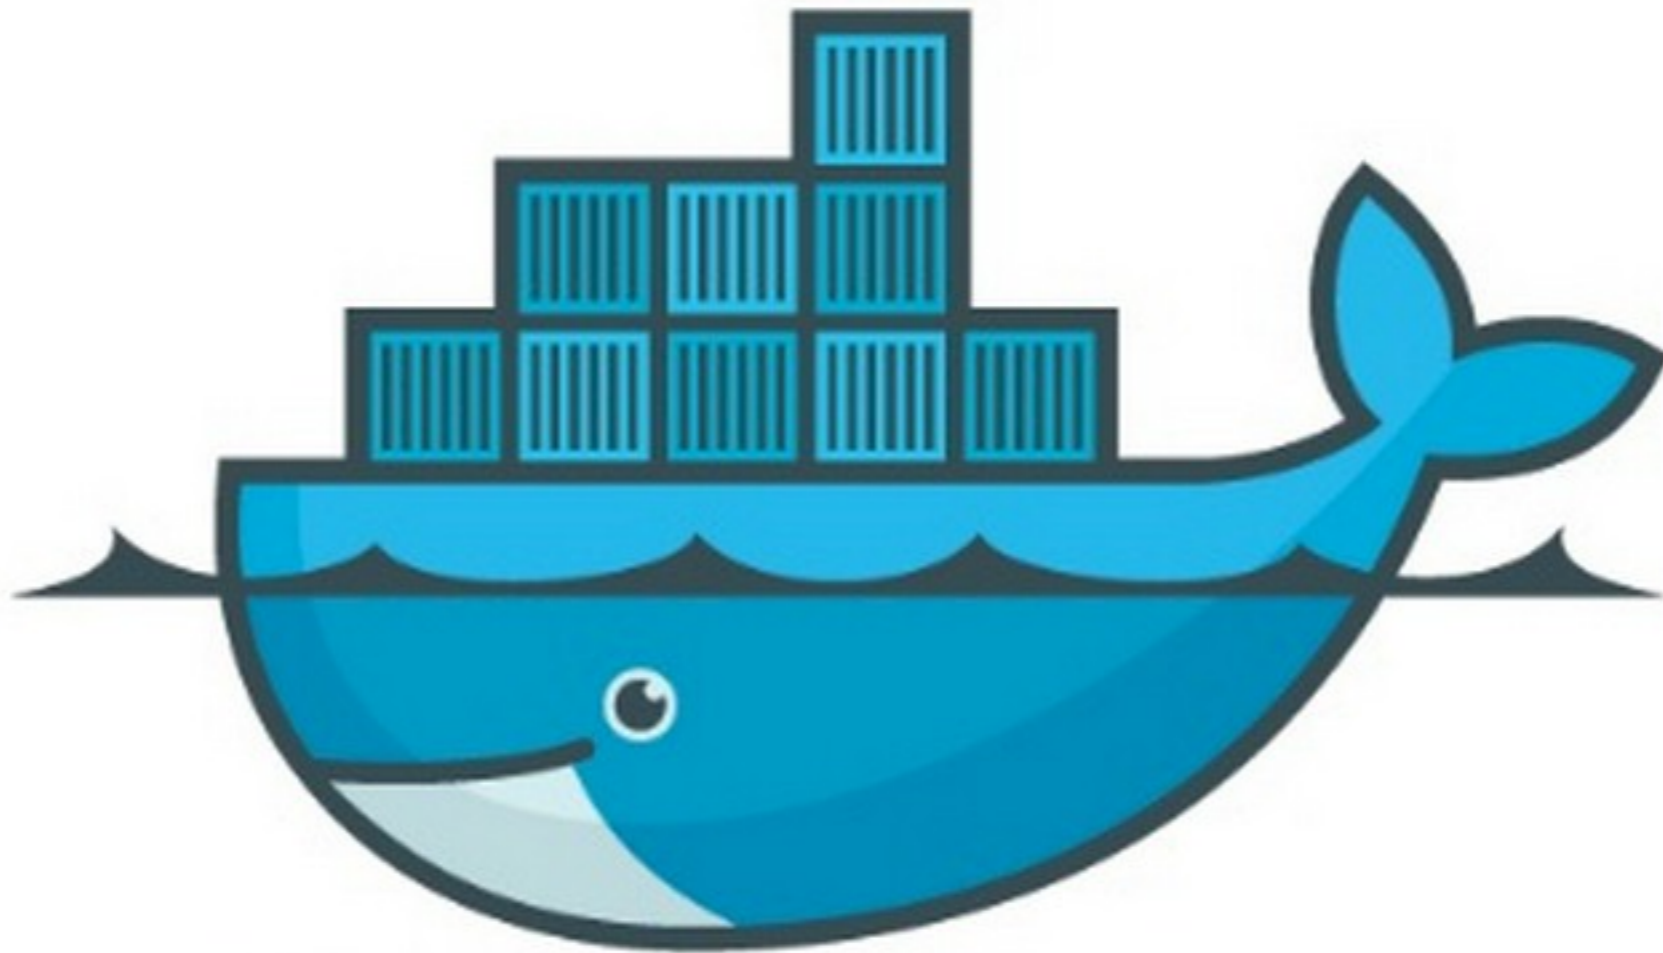

Servers on demand

Create

Adapted for Soft Commande Unique

First results...

- **Target of 5 minutes reached in “pilot” phase**
- Remaining challenges (technical)
 - bring more of the system configuration under version control
 - closer integration of the tools involved

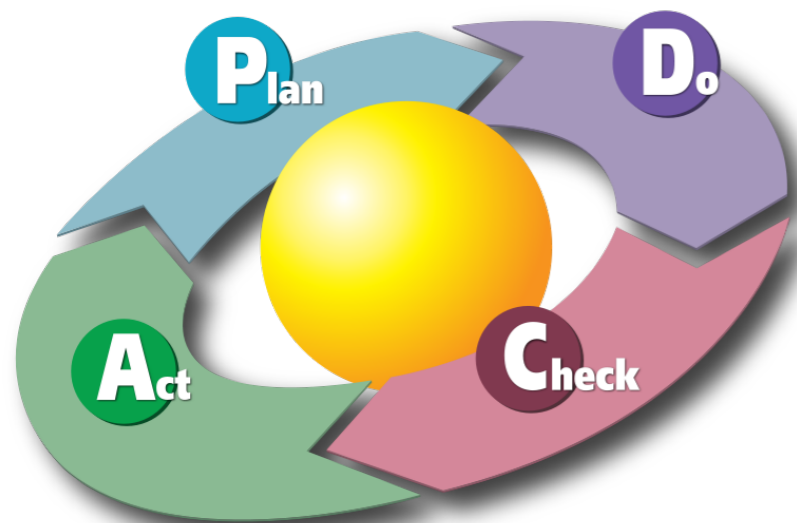

First results...

- Remaining challenges (non-technical)
 - reach 5 minutes consistently
 - align process with reality: count “red bin” defects as official bugs, proactively
 - apply “5 whys” to production bugs

Most importantly...

- Dev and QA *really* collaborating :)

How do we streamline defect reproduction?

Sophisticated tooling
